Imagine Tech, Ghost and $ANO

Official Terminology and Language Standard

Version: 1.0
Language: English
Recommended owner: Imagine Tech Limited
Recommended adoption date: August 16, 2026
Applies to: Websites, applications, product interfaces, legal documents, investor materials, presentations, press releases, social media, street marketing, packaging, events and partner communications.

---

1. Purpose of This Standard

This document establishes one official language system for Imagine Tech, Ghost, Ghost App, ghostOS, Ghost Core, Lucid Wallet, $ANO and the wider product ecosystem.

Its purpose is to:

- Maintain a clear hierarchy between the legal company, corporate brand, ecosystem, products, infrastructure, protocols and digital assets.
- Prevent conflicting descriptions across websites and documents.
- Separate live capabilities from planned or experimental capabilities.
- Replace broad or unverifiable marketing claims with accurate, defensible terminology.
- Provide approved English definitions for all public-facing communications.
- Protect the company from accidental legal, technical or financial overstatement.
- Create one language standard for marketing, product, legal, engineering and investor relations.

---

2. Source Authority Order

When two public materials use different terminology, the following order should apply:

1. **Corporate and product-specific legal documents**
2. **Verified technical specifications and implemented product behavior**
3. **The latest approved Whitepaper**
4. **The Imagine Documentation Center and assurance materials**
5. **Product pages**
6. **General marketing copy**
7. **Experimental demonstrations and sandbox interfaces**

Marketing language must never override the legal identity of an entity, the actual product status or the implemented technical architecture.

The current Ghost legal surface states that Ghost is a child brand of Imagine Tech Limited and not a separate corporate entity. Therefore, references to a legally existing “Ghost Foundation” should not be used unless such an entity is formally incorporated and disclosed.

---

3. Canonical Brand and Product Architecture

```
Imagine Tech Limited
  Imagine Tech
    Imagine Kernel
    Ghost
      Ghost App
        Ghost Messaging
        Ghost Core
        GhostProtocol 1
        Lucid Wallet
        Mini-Apps
        Challenge2Earn
        $ANO
      ghostOS
      Newniverse
      GhostCard
      GhostGlass
      Conceptunomics
        AGAB Economy
        $AGAB
        Future macro-economy assets
```

Architectural rule

- **Imagine Tech Limited** is the legal entity.
- **Imagine Tech** is the corporate and portfolio brand.
- **Ghost** is a child brand and ecosystem.
- **Ghost App** is the user-facing communication and Web3 product.
- **Ghost Core** is the first-party security engine.
- **GhostProtocol 1** is the protocol profile used by Ghost Core.
- **Lucid Wallet** is the native self-custody wallet experience.
- **$ANO** is the application-level utility token.
- **ghostOS** is the planned operating environment.
- **Conceptunomics** is the economic framework.
- **AGAB Economy** is the wider ghostOS-oriented economy.
- **$AGAB** is the token associated with that economy.

---

4. Corporate and Ecosystem Terminology

Imagine Tech Limited

Classification: Legal corporate entity

Official definition:

Imagine Tech Limited is the corporate entity responsible for the development, ownership, coordination and strategic direction of the Imagine technology portfolio, including Ghost, Ghost App, Lucid Wallet, $ANO and related infrastructure, subject to the scope of each product-specific legal notice.

Use the full name in:

- Contracts
- Terms and privacy notices
- Regulatory materials
- Corporate resolutions
- Investment materials
- Invoices
- Official legal statements

The company is identified across the public materials as the operator and controller of the main Imagine, Ghost public-web and Lucid-adjacent surfaces.

Imagine Tech

Classification: Corporate brand

Official definition:

Imagine Tech is a technology holdings brand that develops, acquires and scales advanced technology products, infrastructure and digital ecosystems.

Approved short form:

> Imagine Tech builds and scales advanced technology brands, infrastructure and digital ecosystems.

The company homepage describes Imagine as the holding company behind Ghost, Imagine Kernel, Ghost communication products and $ANO.

Imagine

Classification: Marketing short name

Official definition:

Imagine is the approved short-form brand name for Imagine Tech.

Use **Imagine Tech Limited** when legal identity matters. Use **Imagine Tech** or **Imagine** in marketing and visual branding.

Imagine Portfolio

Classification: Corporate portfolio term

Official definition:

The Imagine Portfolio is the collection of brands, products, infrastructure layers, digital assets and future systems developed, acquired or coordinated by Imagine Tech Limited.

Imagine Kernel

Classification: Infrastructure layer
Status: In development

Official definition:

Imagine Kernel is an in-development modular infrastructure substrate intended to provide shared execution, routing, state continuity, policy boundaries and system orchestration across the Imagine portfolio.

Approved descriptor:

> The modular infrastructure substrate of the Imagine portfolio.

It should not yet be described as a publicly released operating-system kernel unless a deployable implementation, technical specification and supported environments are available. The current Imagine page presents it as a structural layer being shaped across Ghost, Lucid, BaserDB, ImagineAI and future systems.

Ghost

Classification: Child brand and ecosystem

Official definition:

Ghost is Imagine Tech's privacy, digital-sovereignty and secure-interaction brand. It brings communication, identity, wallet interaction, private infrastructure and future operating-system capabilities into one coordinated ecosystem.

Approved short form:

> Ghost is the privacy and digital-sovereignty ecosystem of Imagine Tech.

Legal usage rule:

Do not describe Ghost as a separate company or legally existing foundation unless a separate Ghost entity is formally incorporated and disclosed.

The Ghost homepage calls Ghost the house brand of Imagine, while the Ghost legal page states explicitly that Ghost is currently a child brand of Imagine Tech Limited.

Ghost Ecosystem

Classification: Ecosystem umbrella

Official definition:

The Ghost Ecosystem is the connected environment formed by Ghost App, Ghost Core, Lucid Wallet, $ANO, Mini-Apps, Challenge2Earn, ghostOS and related products, infrastructure and economic layers.

Digital Sovereignty

Classification: Strategic principle

Official definition:

Digital Sovereignty is the ability of users to maintain meaningful control over their identity, communication, devices, data, private keys and digital value without unnecessary dependence on centralized intermediaries.

Digital sovereignty does not mean an absence of lawful controls, public blockchain visibility or user responsibility.

Sovereign Digital Ecosystem

Classification: Ecosystem descriptor

Official definition:

A Sovereign Digital Ecosystem is a coordinated environment in which communication, identity, infrastructure and economic interaction are designed around user control, security boundaries and reduced platform dependence.

Use this term as an ecosystem descriptor, not as a claim of state-level sovereignty or legal immunity.

ghostOS

Classification: Planned operating environment
Official styling: `ghostOS`
Status: Planned / in development

Official definition:

ghostOS is the planned privacy-oriented operating environment of the Ghost ecosystem, intended to unify devices, identity, applications, private infrastructure and digital economic participation.

Approved short form:

> The planned sovereign operating environment of the Ghost ecosystem.

Until a public production version is available, use:

- “planned”
- “in development”
- “designed to”
- “intended to”

Do not use “available now” or “the first” as a factual market claim without evidence and a defined comparison category. The current Ghost site presents ghostOS as a decentralized operating system with privacy, blockchain integration, multiple desktops and Newniverse functionality.

Newniverse

Classification: Future social and universe layer
Status: Planned

Official definition:

Newniverse is the planned decentralized social-universe layer of ghostOS, intended to support social interaction, creation, digital environments and ecosystem participation.

Approved short form:

> The planned decentralized social universe inside ghostOS.

GhostCard

Classification: Future payment product
Status: Planned

Official definition:

GhostCard is a planned Ghost payment product intended to connect supported digital assets and ecosystem services with eligible real-world payment experiences.

Do not describe it as an issued bank card, globally accepted payment card or regulated financial product until the issuer, network, jurisdictions and applicable licenses are confirmed. The public Ghost site currently marks GhostCard as “soon.”

GhostGlass

Classification: Future hardware and secure-device component
Status: Product validation required

Official definition:

GhostGlass is a proposed secure hardware and optical-device component of the Ghost ecosystem, subject to final product validation, technical specifications, manufacturing readiness and market availability.

The Whitepaper treats GhostGlass as a potential future hardware or secure-device ecosystem component and explicitly warns against overstating it before the roadmap and delivery model are finalized.

GhostShell

Classification: Interactive website demonstration

Official definition:

GhostShell is the interactive command-line-style sandbox presented on the Imagine website to demonstrate the visual and conceptual language of the ecosystem.

GhostShell must not be described as a production operating-system shell unless a real executable product is released. The current homepage identifies the experience as a guest sandbox.

---

5. Ghost App and Communication Terminology

Ghost App

Classification: User-facing product

Official definition:

Ghost App is a privacy-preserving communication and Web3 interaction platform that combines secure messaging, identity controls, wallet interaction, Mini-Apps and approved skill-based peer-to-peer challenge experiences.

Approved marketing definition:

> Ghost App brings private communication, user-controlled identity and wallet-aware digital interaction into one secure experience.

Approved technical definition:

> Ghost App is a privacy-preserving communication platform with integrated Web3 functionality, designed around secure messaging, cryptographic trust, Lucid Wallet, supported digital assets, Mini-Apps and Challenge2Earn.

The Whitepaper identifies Ghost App as the primary product and defines it as a privacy-preserving communication platform with integrated Web3 functionality.

Ghost Messaging

Classification: Core Ghost App capability

Official definition:

Ghost Messaging is the secure private-messaging capability inside Ghost App.

Use **Ghost Messaging** as the feature name. Use **Ghost App** as the product name.

Avoid switching between:

- Ghost Chat
- GhostChat
- Ghost Messenger
- Ghost communication app

unless one of those names becomes a separately approved product.

Communication Operating Layer

Classification: Product-category descriptor

Official definition:

A Communication Operating Layer is a product environment in which messaging becomes the secure starting point for identity, wallet actions, Mini-Apps, challenges, community interaction and other digital services.

This term communicates that Ghost App is broader than a conventional messenger without incorrectly calling the application an operating system. The Whitepaper recommends understanding Ghost App as a communication operating layer rather than a narrow messaging product.

Privacy-Preserving Communication Platform

Classification: Preferred product category

Official definition:

A Privacy-Preserving Communication Platform is a communication product designed to reduce unnecessary exposure of message content, metadata and identity while preserving user safety, device security and appropriate compliance controls.

This is the preferred public category for Ghost App.

Communication Economy

Classification: Ecosystem model

Official definition:

A Communication Economy is an environment in which private conversations can lead directly to trusted transfers, challenges, rewards, Mini-App activity, creator participation and developer-built services.

Approved phrase:

> Ghost App is building a privacy-preserving communication economy.

The Whitepaper uses this concept to connect secure communication, Lucid Wallet, $ANO, Mini-Apps and Challenge2Earn.

Private Identity Layer

Classification: User-experience layer

Official definition:

The Private Identity Layer is the Ghost App surface through which users manage aliases, trusted contacts, device access, communication permissions and wallet-linked identity without exposing unnecessary real-world identity.

The Ghost App page currently uses this term for secure chat, access control, virtual calls and wallet-linked identity.

Alias-Based Identity

Classification: Identity model

Official definition:

Alias-Based Identity allows a user to interact through a chosen alias or handle while cryptographic and device-level controls preserve continuity and trust underneath the visible identity.

Pseudonymous Identity

Classification: Privacy and identity term

Official definition:

Pseudonymous Identity allows a user to interact without displaying their legal identity by default, while recognizing that wallet activity, device behavior or voluntary disclosure may still make the user identifiable.

Use **pseudonymous** rather than **completely anonymous**.

Encrypted Communities

Classification: Ghost App community capability

Official definition:

Encrypted Communities are private or community-based spaces within Ghost App that combine protected communication, layered membership permissions, moderation controls and approved Mini-App or challenge functionality.

Secure Calling

Classification: Ghost App communication capability

Official definition:

Secure Calling is the voice or video communication capability within Ghost App, designed to follow the application's security and privacy model.

Do not use **end-to-end encrypted calling** as a production claim until the implemented call architecture and supported platforms have been verified.

In-Chat Value Transfer

Classification: Wallet interaction model

Official definition:

In-Chat Value Transfer is the ability to initiate a digital-asset transfer from a conversation while keeping recipient review, transaction details and final wallet signing explicit.

Core rule:

> Chat creates the intent. The wallet authorizes the execution.

The Whitepaper separates conversation context from user-controlled financial execution and requires transaction review before signing.

Value Rail

Classification: Marketing and product term

Official definition:

The Value Rail is the wallet and token interaction layer that allows supported value to move through Ghost App experiences.

Use it as an ecosystem metaphor. It is not a banking rail, card network or regulated payment system unless separately implemented and licensed.

Mini-App

Classification: Embedded application

Official definition:

A Mini-App is a lightweight first-party or approved third-party application that operates inside or alongside Ghost App and may use approved identity, wallet, challenge, social or reward capabilities.

Mini-Apps may include:

- Games
- Social tools
- Creator utilities
- Community functions
- Reward experiences
- Bots
- Challenge interfaces

Mini-Apps that can affect funds, escrow, rewards or identity require elevated review and permission controls.

Mini-App Marketplace

Classification: Discovery and distribution layer

Official definition:

The Mini-App Marketplace is the planned discovery surface through which users can find approved Mini-Apps, games and utilities based on safety, availability, user feedback, fairness and developer reputation.

Challenge2Earn

Approved abbreviation: C2E
Classification: Skill-based challenge model

Official definition:

Challenge2Earn is Ghost App's skill-based, peer-to-peer challenge model in which participants agree to predefined terms, fund an approved escrow mechanism and receive settlement according to a verified result.

Required positioning:

- Peer-to-peer
- Skill-based
- Pre-agreed
- Transparent
- Limited
- Subject to local law
- Subject to user-protection controls

Prohibited positioning:

- Casino
- Betting platform
- Gambling entertainment
- Guaranteed earning
- Passive income
- Risk-free competition

The Whitepaper expressly distinguishes C2E from house-edge gambling and requires jurisdictional review, no-debt controls, limits, cool-downs and user protection.

---

6. Security and Privacy Terminology

Ghost Core

Classification: First-party native security engine

Official definition:

Ghost Core is Ghost's first-party Rust-based security engine for private communication. It coordinates session establishment, device identity, message protection, replay decisions, durable state transitions, witnessed trust and metadata-aware delivery boundaries.

Approved descriptor:

> The first-party native security engine behind Ghost App.

Ghost Core must not be described as invulnerable, unbreakable or formally verified unless the applicable audit and assurance work has been completed. The Whitepaper itself limits the public claim to an ambitious first-party security architecture whose audit and production evidence must continue to mature.

GhostProtocol 1

Classification: Security protocol profile

Official definition:

GhostProtocol 1 is the fixed protocol profile used by Ghost Core. It is designed to require accepted messages to follow one bounded security contract rather than relying on ambiguous legacy or fallback modes.

End-to-End Encryption

Approved abbreviation: E2EE

Official definition:

End-to-End Encryption is a communication security model in which message content is encrypted on the sender's device and is intended to be decrypted only on the recipient's authorized device.

E2EE protects message content. It does not automatically hide:

- All metadata
- Public blockchain activity
- Screenshots
- Recipient disclosure
- Compromised devices
- User behavior
- External backups

The Whitepaper explicitly distinguishes encrypted message content from metadata, device, user and blockchain risks.

Privacy-Preserving

Classification: Preferred privacy claim

Official definition:

Privacy-Preserving means that a system is designed to minimize unnecessary exposure, reduce reliance on server trust and give users meaningful control over information and identity.

Use **privacy-preserving** instead of:

- Completely anonymous
- Invisible
- Untraceable
- Impossible to monitor
- Guaranteed private

Responsible Privacy

Classification: Privacy and compliance principle

Official definition:

Responsible Privacy means reducing unnecessary exposure while recognizing device compromise, metadata, public blockchain analysis, user disclosure, abuse prevention and lawful compliance requirements.

The Whitepaper expressly states that Ghost App should be described as privacy-preserving rather than invisible or untraceable.

Privacy by Design

Classification: Product-development principle

Official definition:

Privacy by Design means integrating privacy controls, data minimization, local processing, security boundaries and user choice into the architecture from the beginning rather than adding privacy language after development.

Data Minimization

Classification: Privacy control

Official definition:

Data Minimization is the practice of collecting, processing and retaining only the information reasonably required for product functionality, security, support, abuse prevention or legal obligations.

Cryptographic Identity

Classification: Identity-security model

Official definition:

Cryptographic Identity is the use of cryptographic keys and signed identity state to establish continuity, authenticity and trust independently of a visible username alone.

Device Identity

Classification: Security identity layer

Official definition:

Device Identity distinguishes each authorized client installation from the user's wider account identity so sessions, security events and device access can be managed independently.

Device UUID

Classification: Device security identifier

Official definition:

A Device UUID is a device-level identifier used for session binding, device management, login security, request proofs and abnormal-activity detection.

It must not be positioned as an advertising identifier or public identity.

Device Trust

Classification: Security state

Official definition:

Device Trust is the security state assigned to a device after registration, authentication and relevant verification. Changes to trusted device state should create visible security events.

Trust On First Use

Approved abbreviation: TOFU

Official definition:

Trust On First Use is a trust model in which the first observed cryptographic identity for a contact is stored as trusted and later changes are treated as security events requiring review.

Key Transparency

Classification: Identity-assurance model

Official definition:

Key Transparency is a reviewable identity-history model through which account roots, active devices, temporary key publications, revocations and generation changes can be checked against signed and witnessed history.

Witnessed Trust

Classification: Ghost security term

Official definition:

Witnessed Trust is the use of signed checkpoints and independent evidence to reduce dependence on a single mutable identity directory.

Hybrid Session Establishment

Classification: Cryptographic architecture term

Official definition:

Hybrid Session Establishment combines classical and post-quantum cryptographic inputs when establishing protected communication sessions.

Post-Quantum Cryptography

Approved abbreviation: PQC

Official definition:

Post-Quantum Cryptography refers to cryptographic mechanisms designed to resist known attack models involving sufficiently capable quantum computers.

The current Whitepaper architecture references classical and post-quantum mechanisms together. This should be described as an architectural design, not as proof that the entire production system is “quantum-proof.”

Continuous Hybrid State Evolution

Classification: Ghost Core key-evolution model

Official definition:

Continuous Hybrid State Evolution is Ghost Core's conversation-state model in which authenticated transitions advance the session state and derive fresh message material from classical, post-quantum and transcript-bound inputs where available.

Forward Secrecy

Classification: Cryptographic security property

Official definition:

Forward Secrecy is the property intended to limit the effect of a current key compromise on previously protected message material.

Do not describe forward secrecy as absolute protection from a fully compromised endpoint.

Relay Server

Classification: Delivery infrastructure

Official definition:

A Relay Server coordinates encrypted payload delivery, routing, registration and availability without being intended to operate as a trusted reader of private message content.

Wallet Signing Boundary

Classification: Financial-security boundary

Official definition:

The Wallet Signing Boundary is the separation between an action proposed by Ghost App and the final transaction authorization performed by the user's wallet.

This boundary preserves explicit consent and prevents an ordinary chat action from silently becoming a financial transaction.

Named Cryptographic Architecture

The Whitepaper currently references the following architectural components:

- **X448** - classical key agreement
- **ML-KEM-1024** - post-quantum key encapsulation
- **Ed448** - classical digital signatures
- **ML-DSA-87** - post-quantum digital signatures
- **SLH-DSA** - hash-based post-quantum signature architecture
- **HKDF-SHA-512** - domain-separated key derivation
- **AES-256-GCM-SIV** - authenticated encryption designed to provide nonce-misuse resistance
- **OPAQUE** - asymmetric password-authenticated key exchange

These names may be used in technical documentation with the qualifier **“the current architecture is designed around”** until production implementation, audit results and supported platforms are confirmed.

---

7. Lucid Wallet and Blockchain Terminology

Lucid Wallet

Classification: Native self-custody wallet experience

Official definition:

Lucid Wallet is the native self-custody wallet experience developed by Imagine for Ghost App. It is designed to support $ANO and selected EVM-compatible assets while preserving user control over private keys and transaction authorization.

Approved short form:

> Lucid is the self-custody wallet experience of Ghost App.

The Whitepaper describes Lucid as the native wallet experience and product bridge between communication and Web3. The Lucid Privacy Notice states that Lucid is designed around minimal collection and does not collect or store private keys or secret recovery phrases.

Non-Custodial Wallet

Classification: Technical and legal wallet model

Official definition:

A Non-Custodial Wallet is a wallet model in which the user controls the private keys and authorizes transactions. The product may prepare, explain and broadcast transactions, but it does not hold the user's assets as a custodian.

Self-Custody

Classification: Consumer-facing wallet term

Official definition:

Self-Custody means that the user, rather than Imagine Tech, Ghost or Lucid, remains responsible for wallet credentials, recovery methods and transaction approvals.

Use **self-custody** in consumer marketing and **non-custodial** in technical and legal materials.

Local Signing

Classification: Wallet-security mechanism

Official definition:

Local Signing means that transaction authorization takes place within the user's wallet or authorized device environment rather than being silently performed by the communication platform.

Wallet Intent

Classification: Product and API term

Official definition:

A Wallet Intent is a structured user request to prepare a wallet action, such as sending an asset or interacting with a smart contract, before final user review and signing.

Public-Chain Observability

Classification: Required risk term

Official definition:

Public-Chain Observability means that wallet addresses, balances, transaction hashes, timestamps, approvals and contract interactions may remain visible on public blockchain networks and third-party indexing services.

This term must be included wherever privacy and blockchain activity are discussed together. The Lucid notice and Ghost legal page both state that blockchain records may remain public even when the surrounding application is privacy-oriented.

EVM-Compatible

Classification: Network compatibility term

Official definition:

EVM-Compatible describes a network, asset, wallet or smart contract that operates with infrastructure based on the Ethereum Virtual Machine model.

Compatibility does not automatically mean support. A product must list the networks and assets it actually supports.

BNB Smart Chain

Approved abbreviation: BSC where necessary

Official definition:

BNB Smart Chain is the EVM-compatible blockchain network currently referenced for the deployed $ANO token.

Use **BNB Smart Chain**, not the outdated primary wording **Binance Smart Chain**.

BEP-20

Classification: Token standard

Official definition:

BEP-20 is the fungible-token standard used by compatible tokens on BNB Smart Chain.

A token deployed only on BNB Smart Chain should be described as:

> A BEP-20 token on BNB Smart Chain.

It should not be described as “ERC-20 on Binance Smart Chain.”

---

8. $ANO Terminology

ANO Token

Classification: Token name

Official definition:

ANO Token is the formal asset name associated with the ticker `$ANO`.

$ANO

Classification: Application-level utility token

Official definition:

$ANO is the application-level utility token designed to power activity within the Ghost App ecosystem, including supported transfers, Mini-App activity, Challenge2Earn settlement, creator incentives, developer incentives, social rewards and ecosystem fee flows.

Approved short form:

> $ANO is the utility token of the Ghost App economy.

Approved expanded form:

> $ANO connects communication, wallet interaction, Mini-Apps, peer-to-peer challenges and ecosystem rewards inside Ghost App.

$ANO must not be presented as:

- Equity in Imagine Tech Limited
- A share of company revenue
- Debt
- A guaranteed investment
- A guaranteed source of income
- “Imagine's Bitcoin”
- A promise of exchange listing
- A promise of price appreciation

The Whitepaper repeatedly defines $ANO as functional utility infrastructure rather than an investment promise.

$ANO Utility Layer

Classification: Ecosystem role

Official definition:

The $ANO Utility Layer is the economic layer connecting supported messaging-based transfers, Lucid Wallet, Mini-Apps, Challenge2Earn, developers, creators and community incentives.

$ANO Activity Token

Classification: Optional marketing descriptor

Official definition:

$ANO may be described as an activity token when explaining that its intended utility is connected to actions performed inside the ecosystem.

The preferred legal and technical classification remains:

> Application-level utility token.

$ANO Market Desk

Classification: Public information surface

Official definition:

The $ANO Market Desk is the official public information surface for displaying selected $ANO contract, market, liquidity, pool and utility information derived from public on-chain sources.

It is an information surface, not an exchange, broker, investment service or guarantee of data completeness.

ANO/WBNB Trading Pair

Classification: Decentralized market pair

Official definition:

The ANO/WBNB Trading Pair is the decentralized liquidity pair through which eligible users may exchange $ANO and Wrapped BNB using the supported PancakeSwap V2 route.

Liquidity Pool

Classification: Decentralized exchange mechanism

Official definition:

A Liquidity Pool is a smart-contract-based pool of assets used to support decentralized token exchange.

Liquidity Lock

Classification: Token-market control

Official definition:

A Liquidity Lock is a mechanism that restricts access to specified liquidity-provider positions or related assets for a defined period.

A liquidity lock does not guarantee:

- Token price
- Trading volume
- Permanent liquidity
- Market stability
- Protection from every contract or market risk

Ecosystem Fee

Classification: Economic mechanism

Official definition:

An Ecosystem Fee is a fee that may apply to selected economic actions in order to support product operations, developers, creators, security, social-impact programs, incentives and ecosystem reserves.

Current publication status: Unreconciled

The $ANO Market Desk currently refers to a 1.95% fee, while the Whitepaper refers to a 1.5% ecosystem fee and explicitly requires reconciliation of the routing table. No master marketing material should publish a definitive fee percentage until the deployed contract and the approved allocation model are reconciled.

Treasury

Classification: Ecosystem reserve

Official definition:

The Treasury consists of controlled token or asset reserves intended for approved development, operations, liquidity, security, partnerships, incentives, social impact or contingencies.

Ecosystem Allocation Wallet

Classification: Preferred wallet-governance term

Official definition:

An Ecosystem Allocation Wallet is a wallet assigned to a defined ecosystem purpose, with documented ownership, controls, release rules and reporting obligations.

Use this instead of **Foundation Wallet** until a legally established foundation exists.

Vesting

Classification: Token-release mechanism

Official definition:

Vesting is a schedule that controls when allocated tokens become available for transfer or use.

Lockup

Classification: Transfer restriction

Official definition:

A Lockup is a defined period during which specified tokens or wallet allocations cannot be transferred, released or used except under approved conditions.

Token Generation Event

Approved abbreviation: TGE

Official definition:

A Token Generation Event is the official creation or public-launch event of a token, including its network, standard, supply, contract address, launch venue and initial distribution structure.

Centralized Exchange Readiness

Approved abbreviation: CEX Readiness

Official definition:

Centralized Exchange Readiness is the process of preparing verified contracts, legal documentation, liquidity history, security reports, treasury information, product metrics and compliance materials for independent exchange evaluation.

CEX Readiness is not a guarantee of listing.

Provisional $ANO Metadata

The current public materials reference:

- **Token name:** ANO Token
- **Ticker:** `$ANO`
- **Network:** BNB Smart Chain
- **Standard:** BEP-20 / EVM-compatible
- **Contract reference:** `0xD1C4B3DBedB71545F7464A79021ca7c365926eA9`
- **Working total supply:** `1,000,000,000,000 ANO`
- **Primary decentralized route:** ANO/WBNB on PancakeSwap V2

The Whitepaper itself marks the token standard, total supply, decimals, owner functions, fee logic, explorer information and other contract details as requiring final verification. Therefore, this information should be labeled **Provisional Token Metadata** until the approved contract-verification package is completed.

---

9. Developer and Challenge Terminology

Developer SDK

Classification: Developer toolkit

Official definition:

The Developer SDK is the planned collection of tools, libraries, documentation and sandbox capabilities through which approved developers can build Mini-Apps, games, bots and utilities for Ghost App.

API Layer

Classification: Integration layer

Official definition:

The API Layer is the controlled interface through which approved Mini-Apps may interact with permitted Ghost App capabilities such as authentication, wallet intents, challenge state, rewards, result submission and reporting.

API access should be permissioned, authenticated, rate-limited and auditable.

Developer Revenue Sharing

Classification: Ecosystem incentive

Official definition:

Developer Revenue Sharing is the approved distribution of defined Mini-App or ecosystem fees to developers whose products generate legitimate, secure and policy-compliant usage.

Creator Rewards

Classification: Ecosystem incentive

Official definition:

Creator Rewards are approved $ANO or ecosystem incentives provided to creators, game designers or community operators for measurable contributions to utility, engagement and retention.

Skill-Based Peer-to-Peer Competition

Classification: Required C2E category

Official definition:

Skill-Based Peer-to-Peer Competition is a structured activity in which users compete directly under predefined rules and the result depends primarily on participant skill rather than a house-controlled random outcome.

Smart Escrow

Classification: Challenge settlement mechanism

Official definition:

Smart Escrow is an approved smart-contract or controlled mechanism that temporarily locks participant funds until a challenge result is verified, refunded or resolved under predefined rules.

No-Debt Rule

Classification: User-protection control

Official definition:

The No-Debt Rule prohibits the platform from extending credit, creating negative challenge balances or encouraging users to borrow in order to participate.

Result Verification

Classification: Challenge-integrity control

Official definition:

Result Verification is the process of validating the outcome of a Mini-App or challenge before settlement is executed.

Draw Protection

Classification: Challenge-protection control

Official definition:

Draw Protection ensures that funds are returned or handled according to predefined rules when a valid winner cannot be established.

Dispute Window

Classification: Challenge-resolution period

Official definition:

A Dispute Window is the defined period during which a participant may submit approved evidence or challenge the recorded result before final settlement.

Responsible Gaming Controls

Classification: Required user-protection system

Official definition:

Responsible Gaming Controls include participation limits, loss alerts, cooling-off periods, self-exclusion, educational notices, age or jurisdictional restrictions and clear risk information.

These controls must exist before broad C2E availability, not after public scaling.

Jurisdictional Restrictions

Classification: Compliance control

Official definition:

Jurisdictional Restrictions are product, age, location or legal-access limitations applied when a feature cannot be lawfully or responsibly offered in a particular territory or user context.

---

10. Social and Economic Mechanisms

Homesh

Classification: Social-impact allocation
Status: Final governance required

Official definition:

Homesh is the proposed social-impact allocation within the $ANO ecosystem, intended to support approved charitable, community-assistance or public-benefit initiatives.

Before public use, the company should define:

- Purpose
- Eligibility
- Wallet
- Controller
- Release rules
- Reporting
- Governance

Support2Reward

Approved abbreviation: S2R
Status: Final mechanics required

Official definition:

Support2Reward is a proposed ecosystem reward mechanism intended to recognize legitimate support, contribution or community participation.

The activity that qualifies as “support” and the reward calculation must be defined before launch.

Friend Bring Friend

Approved abbreviation: FBF
Preferred public name: Referral Rewards
Status: Anti-abuse model required

Official definition:

Friend Bring Friend is the ecosystem referral mechanism intended to reward legitimate user acquisition under defined eligibility and anti-abuse controls.

For international marketing, **Referral Rewards** is clearer and more professional than “Friend Bring Friend.”

---

11. Conceptunomics and AGAB Terminology

Conceptunomics

Official styling: `Conceptunomics™` where trademark use is approved
Classification: Economic framework

Official definition:

Conceptunomics is the proprietary economic-design framework intended to organize value creation, utility, participation, incentives, fees and digital ownership across the Ghost ecosystem.

Approved short form:

> The economic framework powering the Ghost ecosystem.

This definition follows the current AGAB page.

AGAB Economy

Classification: ghostOS-oriented economic system

Official definition:

The AGAB Economy is the broader economic environment intended to support creation, trading, building, participation, rewards, services and digital ownership across ghostOS and related ecosystem surfaces.

$AGAB

Classification: Proposed cornerstone token of the AGAB Economy

Official definition:

$AGAB is the digital asset positioned as the cornerstone token of the wider ghostOS economy.

Required distinction:

- **Conceptunomics** is the economic framework.
- **AGAB Economy** is the economic system.
- **$AGAB** is the token.
- **AGAB** must not be used alone when the intended meaning is unclear.

The current Ghost page describes $AGAB as the cornerstone token of the ghostOS economy, while the Whitepaper uses AGAB more broadly as an ecosystem identity. This distinction resolves that conflict.

$AGAB Token Standard

The current AGAB page uses the phrase:

> ERC-20 / BEP-20 on Binance Smart Chain

This wording should be corrected.

Use:

> BEP-20 token on BNB Smart Chain

If a separate Ethereum deployment exists, publish it independently as:

> ERC-20 token on Ethereum

Each deployment must have its own contract address and network disclosure.

$COIN

Classification: Provisional future macro-economy asset
Status: Not cleared as a live product

Official definition:

$COIN is a provisional future macro-economy token referenced in ecosystem materials, subject to final technical mechanics, eligibility, timing, economic design and legal review.

Do not market $COIN as launched, guaranteed or automatically exchangeable with $ANO.

Concept-18

Status: Undefined

Concept-18 appears in the AGAB materials as a fee concept, but no sufficiently complete public definition is provided.

Publication rule:

Do not use Concept-18 in public-facing materials until the company defines:

- What “18” represents
- Which activities are covered
- Who pays the fee
- How the fee is calculated
- Where it is routed
- Applicable contracts
- Applicable jurisdictions

SCT

Status: Undefined acronym

SCT appears in connection with assets, attributes, skills, treasures, collections and decorations, but its full name and technical classification are not publicly defined.

Publication rule:

Do not use `SCT` externally until the acronym, object model and economic role are formally approved.

---

12. Trust, Compliance and Documentation Terminology

Imagine Documentation Center

Classification: Public trust and documentation hub

Official definition:

The Imagine Documentation Center is the central public location for corporate policies, Lucid Wallet documentation, regulatory materials, assurance artifacts, processor records and implementation references.

Trust Program

Classification: Governance and assurance program

Official definition:

The Trust Program is the coordinated set of privacy, security, accessibility, vendor-governance, rights-handling and assurance activities maintained across the covered Imagine and Lucid public surfaces.

Live Baseline

Classification: Status label

Official definition:

Live Baseline means that a public policy, control, workflow or documentation baseline is implemented for the stated scope.

It does not mean that every underlying program is externally audited or certified.

Operational Baseline

Classification: Status label

Official definition:

Operational Baseline means that the identified process or control is active within the described operational scope.

Implemented

Classification: Status label

Official definition:

Implemented means that the stated feature, control or public baseline exists for the specifically identified scope.

The Docs Center explicitly states that “implemented” does not automatically mean externally audited or formally certified.

In Progress

Classification: Status label

Official definition:

In Progress means that implementation, evidence preparation or audit-readiness work is underway but has not reached final completion or certification.

Use this label for current SOC 2 and ISO readiness work unless and until a completed report or certification is issued.

Planned

Classification: Product-status label

Official definition:

Planned means that a capability is included in the product strategy or roadmap but is not represented as currently available.

In Development

Classification: Product-status label

Official definition:

In Development means that active implementation work is underway, but the product or capability has not yet met all release requirements.

Alpha

Classification: Product-status label

Official definition:

Alpha means an early controlled implementation intended primarily to validate architecture and core functionality.

Closed Beta

Classification: Product-status label

Official definition:

Closed Beta means that a limited group of approved users is testing the product under controlled access and monitoring.

Public Beta

Classification: Product-status label

Official definition:

Public Beta means that broader users may access the product while functionality, reliability and security controls continue to mature.

Provisional

Classification: Verification-status label

Official definition:

Provisional means that information is currently used as a working reference but remains subject to verification, approval or reconciliation.

Use this for unresolved Whitepaper metadata, fee models, allocations, wallet addresses and future product mechanics.

Audit Complete

Classification: Assurance-status label

Official definition:

Audit Complete may be used only when the defined audit scope has been completed and the applicable report, date and auditing party can be identified.

Certified

Classification: Formal assurance-status label

Official definition:

Certified may be used only when a valid external certification has been issued for the stated entity, product, standard, scope and period.

Customer Assurance Packet

Classification: Customer-safe diligence artifact

Official definition:

The Customer Assurance Packet is the sanitized public diligence package that summarizes current privacy, security, control-readiness and evidence-governance baselines without exposing confidential audit or security material.

The current packet expressly avoids claiming completed SOC 2 or ISO certification.

Compliance by Design

Classification: Product-governance principle

Official definition:

Compliance by Design means incorporating privacy, consumer protection, jurisdictional controls, security, risk review and regulatory limitations into product architecture and feature design from the beginning.

Risk-Based Compliance

Classification: Compliance model

Official definition:

Risk-Based Compliance applies additional controls when the legal, financial, geographic, behavioral or security risk of a feature or activity increases.

Basic private messaging and high-risk financial activity do not necessarily require identical controls.

Role-Based Access Control

Approved abbreviation: RBAC

Official definition:

Role-Based Access Control assigns permissions according to defined roles and responsibilities rather than granting every authenticated user the same access.

Step-Up MFA

Classification: Privileged-access control

Official definition:

Step-Up MFA is an additional authentication requirement applied before privileged, sensitive or high-risk actions are permitted.

Tamper-Evident Audit Trail

Classification: Security and governance control

Official definition:

A Tamper-Evident Audit Trail is a structured sequence of security or administrative events designed to make unauthorized alteration detectable through integrity checks and sequence-aware sealing.

The assurance materials describe RBAC, step-up MFA and a tamper-evident audit chain as current control areas within the covered trust program.

---

13. Mandatory Status Vocabulary

Status	Meaning	Permitted claim
Live	Available to the intended users in the stated environment	“Available now”
Operational Baseline	Process or control is active for the defined scope	“Operational for the covered scope”
Public Beta	Publicly accessible but still being tested and improved	“Available in public beta”
Closed Beta	Accessible to a limited approved user group	“Currently in closed beta”
Alpha	Early controlled implementation	“In alpha testing”
In Development	Active implementation is underway	“Currently in development”
Planned	Included in the strategy or roadmap	“Planned for a future release”
Provisional	Working information awaiting verification	“Subject to final verification”

Status	Meaning	Permitted claim
In Progress	Compliance or assurance work has started but is incomplete	“Readiness work is in progress”
Audit Complete	Defined audit has been completed	Name the auditor, scope and date
Certified	External certification has been issued	Name the standard, entity, scope and validity period
Compatible	Technically capable of working with another system	Do not imply native integration
Integrated	A tested connection exists inside the product	Name the supported environment
Native	Built directly into the product	Use only where actually implemented

14. Mandatory Corrections to Current Public Language

Current or conflicting wording	Approved replacement	Reason
Ghost Foundation	Ghost, a child brand of Imagine Tech Limited	No separate Ghost corporate entity is currently disclosed
Revolutionary technology foundation	Privacy and digital-sovereignty ecosystem of Imagine Tech	Keeps the brand description separate from legal status
Imagine's own bitcoin	$ANO, the utility token of the Ghost App ecosystem	$ANO is not Bitcoin
Anonymous transactions	User-controlled digital-asset transfers within a privacy-preserving communication environment	Public blockchain activity may remain observable
Military-grade security	First-party security architecture built around Ghost Core and layered cryptographic controls	“Military-grade” is not a defined assurance standard
Competitive money games	Skill-based peer-to-peer challenges	More accurate product and legal category
Stake-based games	Escrow-funded skill challenges, where permitted	Avoids gambling-style language
Guaranteed privacy	Privacy-preserving by design	No responsible product can guarantee complete privacy

Current or conflicting wording	Approved replacement	Reason
Completely untraceable	Designed to reduce unnecessary exposure	Devices, users and blockchains may expose information
Blockchain based	Blockchain-integrated	Use “based” only if the underlying system truly depends on blockchain execution
ERC-20 / BEP-20 on Binance Smart Chain	BEP-20 token on BNB Smart Chain	Correct network-standard terminology
ANO coin	ANO Token or $ANO	Consistent asset naming
GhostChat	Ghost App or Ghost Messaging	Separates product from feature
Foundation Wallet	Ecosystem Allocation Wallet	Avoids suggesting a legal foundation exists
Public Whitepaper	Public Draft Whitepaper v0.9	The current document still contains verification items and TBD fields
Ready now	Live, Beta, In Development or Planned	The status must match actual availability
Already connected	Integrated, compatible or planned	State the exact integration status
Zero fees	Network and product fees are displayed before authorization	The Whitepaper expressly rejects “zero fees” as the general claim
Guaranteed exchange listing	Centralized Exchange Readiness	Exchanges make independent listing decisions
Guaranteed earning	Ecosystem rewards subject to eligibility and risk	Avoids a financial-return promise

15. Terms Not Cleared for Unqualified Public Use

The following terms require further corporate, technical or legal definition before they should appear as established public products:

- Ghost Foundation
- PLANET
- freedomNet
- BaserDB
- ImagineAI
- Concept-18
- SCT

- $COIN as a live asset
- “Quantum-proof”
- “Military-grade”
- “Fully anonymous”
- “Completely decentralized”
- “Unhackable”
- “Guaranteed private”
- “Guaranteed earnings”
- “Guaranteed liquidity”
- “Official Binance listing”
- “Bank”
- “Custodian”
- “Broker”
- “Insurer”
- “Global payment card”

BaserDB, ImagineAI and freedomNet may remain internal or working names until each receives:

1. A product classification
2. A one-sentence approved definition
3. An owner
4. A current status
5. A technical scope
6. A legal operator
7. A public availability statement

---

16. Whitepaper Terminology Status

Approved document name

$ANO Whitepaper - Public Draft v0.9

Approved description

The $ANO Whitepaper is the public draft technical, product and ecosystem document describing the intended architecture, utility framework, security model, economic design and strategic development of $ANO, Ghost App and Lucid Wallet.

Required qualification

The current Whitepaper should not be described as final because it expressly requires verification of:

- Token metadata
- Total supply
- Decimals
- Contract functions
- Wallet addresses
- Allocation percentages

- Vesting
- Fee routing
- PancakeSwap launch information
- Legal review
- Smart-contract review
- Privacy-policy alignment
- Lucid custody model
- Supported jurisdictions
- App-store status
- Product availability
- Risk disclosures
- Official publication references

The file is marked Public and v0.9, while also stating that key information must be verified before final public release.

---

17. Approved Master Positioning Statements

Imagine Tech

> Imagine Tech is a technology holdings company building and scaling advanced infrastructure, privacy, communication, wallet and digital-economy products.

Ghost

> Ghost is Imagine Tech's privacy and digital-sovereignty ecosystem, connecting secure communication, identity, wallet interaction and future operating-system infrastructure.

Ghost App

> Ghost App is a privacy-preserving communication and Web3 interaction platform built around secure messaging, user-controlled identity, Lucid Wallet, Mini-Apps and approved skill-based peer-to-peer challenges.

Ghost Core

> Ghost Core is the first-party native security engine behind Ghost App, designed to coordinate protected messaging, device identity, session state and cryptographic trust.

Lucid Wallet

> Lucid Wallet is the native self-custody wallet experience of Ghost App, designed to make supported digital assets usable without transferring control of private keys to the platform.

$ANO

$ANO is the application-level utility token of the Ghost App economy, designed for supported transfers, Mini-App activity, challenges, developer incentives, creator rewards and ecosystem participation.

Imagine Kernel

Imagine Kernel is the in-development modular infrastructure substrate intended to unify execution, routing, policy and state continuity across the Imagine portfolio.

ghostOS

ghostOS is the planned privacy-oriented operating environment of the Ghost ecosystem, intended to connect devices, identity, applications, infrastructure and digital economic participation.

Conceptunomics

Conceptunomics is the proprietary economic framework intended to organize value creation, utility, participation and incentives across the Ghost ecosystem.

AGAB Economy

The AGAB Economy is the wider ghostOS-oriented economic environment for creation, trading, participation, services and digital ownership.

---

18. Approved Short Marketing Lines

These lines are suitable for street marketing, printed materials, event signage and short-form media, provided the linked feature status is accurate.

Corporate

Built by Imagine Tech.

One portfolio. Multiple layers of the future.

Infrastructure, privacy and digital ownership - built as one system.

Ghost

Own your communication. Control your digital identity.

Private communication. User-controlled value.

A new layer for identity, communication and ownership.

Ghost App

Speak privately. Sign locally. Move value directly.

Messaging is only the beginning.

Your communication. Your identity. Your wallet.

One secure surface for communication and digital interaction.

Ghost Core

Security is not a feature. It is the core.

First-party security, built into the communication layer.

Protected by Ghost Core.

Lucid Wallet

Your keys. Your approval. Your wallet.

Communication meets self-custody.

The wallet stays under your control.

$ANO

The utility token of the Ghost App economy.

Built for activity, not empty speculation.

One utility layer across communication, Mini-Apps and challenges.

Challenge2Earn

Challenge skill. Agree on the rules. Settle the verified result.

Peer-to-peer challenges built around skill and consent.

ghostOS

A sovereign operating environment in development.

The future operating layer of the Ghost ecosystem.

---

19. Final Language Rule

Every public statement must answer four questions:

1. **What is the thing?**
2. **Who legally operates it?**
3. **What is its current status?**
4. **What can be proven today?**

The official language of the ecosystem should remain:

> Precise enough for engineering.
> Responsible enough for legal review.
> Clear enough for everyday users.
> Powerful enough for global marketing.
